

PATIENT INSTRUCTIONS ON COLLECTING A 24 HOUR URINE COLLECTION:

INSTRUCTIONS

- The container you collect your urine in is dependent on the study being done. Some tests require preservatives added to the bottle. Please stop by the lab with your lab order form to pick up your collection container so the correct collection bottle is used.
- You should collect every drop of urine during each 24-hour period. It does not matter how much or little urine is passed each time, as long as every drop is collected.
- Begin the urine collection in the morning after you wake up, after you have emptied your bladder for the first time.
- Urinate (empty the bladder) for the first time and flush it down the toilet. Note the exact time (eg, 7:00 AM). You will begin the urine collection at this time.
- Collect every drop of urine during the day and night in an empty collection bottle. Store the bottle in the refrigerator or in a cooler on ice.
- If you need to have a bowel movement, any urine passed with the bowel movement should be collected. Try not to include feces with the urine collection. If feces does get mixed in, do not try to remove the feces from the urine collection bottle.
- Finish by collecting the first urine passed the next morning, adding it to the collection bottle. This should be within ten minutes before or after the time of the first morning void on the first day (which was flushed). In this example, you would try to void between 6:55 and 7:05 on the second day.
- If you need to urinate one hour before the final collection time, drink a full glass of water so that you can void again at the appropriate time. If you have to urinate 20 minutes before, try to hold the urine until the proper time.

Please note the exact time of the final collection, even if it is not the same time as when collection began on day one.

STORAGE - The bottle(s) should be kept cool or refrigerated and returned within 24 hours of completing the collection.
